

CYBERSECURITY THREAT REPORT

Awareness & Research Project (2024-2025)

Submitted By: Mohit Regar

DEFINING CYBERSECURITY

WHAT IS IT?

Cybersecurity is the practice of protecting systems, networks, and programs from digital attacks. These attacks are usually aimed at accessing, changing, or destroying sensitive information.

CORE OBJECTIVES

Protection of computers, mobile devices, electronic systems, networks, and data from malicious attacks. It ensures the continuity of digital operations and privacy.

WHY IT MATTERS IN 2025

PERSONAL PROTECTION

Shields sensitive personal information from theft.

BUSINESS SECURITY

Ensures continuity and protects corporate assets.

FRAUD PREVENTION

Stops hacking and financial fraud attempts.

AI-POWERED PHISHING

Artificial Intelligence is supercharging fraud. McKinsey reports a 1200% increase in phishing since generative AI emerged.

- > Fake AI-generated emails and websites
- > Hyper-realistic Deepfakes and social engineering
- > Tricking users into sharing passwords & OTPs

RANSOMWARE-AS-A-SERVICE

RaaS is a subscription model that allows affiliates to use

already-developed ransomware tools to execute attacks.

- > Criminals sell ready-made ransomware kits
- > Victim files are encrypted instantly
- > High financial payouts demanded in crypto

| CLOUD MISCONFIGURATIONS

THE VULNERABILITY

Incorrect cloud settings (AWS/Azure/GCP) that expose internal data to the public internet without proper authentication.

THE SOLUTION

Implementation of robust Identity and Access Management (IAM) and regular security audits of cloud infrastructures.

IOT SECURITY RISKS

CONNECTED VULNERABILITIES

With billions of smart devices, weak passwords and unpatched firmware create massive entry points for hackers.

- > Smart devices can be remotely hijacked
- > Firmware updates are often neglected
- > Requires segmented network security

| ZERO-DAY VULNERABILITIES

30K+

New Vulnerabilities in 2024

IMMEDIATE THREAT

A Zero-Day exploit attacks a software vulnerability that is unknown to the vendor. Because there is no patch, the potential for damage is severe and immediate. Detection takes an average of 258 days without AI assistance.

MAJOR BREACHES HISTORY

2017

WannaCry Ransomware
Global Lockdown

2019

Capital One Breach
Cloud Misconfiguration

2020

SolarWinds Attack
Supply Chain Hack

2024

AI Fraud Surge
Identity Theft Peak

ECONOMIC IMPACT ANALYSIS

Metric Type	Statistic (2024/25)	Primary Consequence
Avg. Breach Cost	\$4.88 Million	Financial Loss & Downtime
Phishing Influence	30% of Global Breaches	Credential Harvesting
Identity Fraud Loss	\$27.2 Billion	Personal Financial Ruin
Human Element	68% of All Breaches	Social Engineering Success

PREVENTIVE MEASURES

MFA

Multi-Factor Authentication
adds vital layers.

UPDATES

Regular software patches
close vulnerabilities.

TRAINING

Employee awareness is the
first line of defense.
